## CITABLE UNITS ASSIGNMENT

1. Through a study of 411 participants, Marcinechová and Záhorcová (2020) found that sexual satisfaction and sexual shame were linked. They admit that this is an area that needs greater study to show the variability of the link.
2. Lutwaka, Panisha, and Ferrari (2003) concluded, through a study involving 141 undergraduate students, that a propensity to shame is highly correlated to a fear of intimacy.
3. Although increased shame and guilt, according to a quantitative research project by Murray, Ciarrocchi, and Murray-Swank (2007), can be highly correlated with a lack of perceived relationship with God, the study found that shame was less correlated with sexuality. This is, by the author's own admission, not in keeping with other contemporary research and the disparity was attributed to the lack of significant shame measures.
4. As I understand Volk, Thomas, Sosin, Jacob, & Moen (2016) developing religious views of sexuality at younger ages could decrease the future generations harmful beliefs and sexual shame.
5. Droubay, Shafer, Miles, Butters, and Grubbs (2021) summarize that users of pornography are more likely to hide their consumption if they experience feelings of shame.
6. Sex is seen as danger to women who have shame over their bodies and reproductive cycles according to a study by Schooler, Ward, Merriwether, and Caruthers (2005). The conclusion of this study is that women either take more risks with sex or avoid sex based on the degree of shame.
7. Reducing shame can give women the emotional power they need to make sex safer (Schooler et al., 2005).
8. A curious discovery from a study by Droubay et al. (2020) suggests that shame may be associated with general distress related to unwanted sexual behavior (specifically pornography use when it is viewed as morally wrong).
9. Droubay et al. (2020) suggest that automatically making pornography use abnormal may detract from a clinician's ability to move clients out of distress.

## CITABLE UNITS ASSIGNMENT

10. Integrating the identity of a religious group and a particular sexuality (specifically gay men) was seen to decrease the amount of gay shame among a study of 194 men in 2020 (Anderson & Koc, 2020)
11. In a study of 133 Caucasian and Asian gay men, Meladze and Brown (2015) found that internalized shame was a predictor of internalized feelings that homosexuality is both abnormal and immoral.
12. An interesting qualitative integration of church history, cultural history, technological history and pre-marital sex history was used to conclude that contraceptive technology has decreased the need for parental, cultural and church shaming as a part of sexual socialization of children (Fernandez-Villaverde et al., 2014)
13. A 2016 qualitative study by Dobson et al., self-reporting by teenaged girls claimed that it was shameful for girls to be seen as sexual and that sexting often gave boys a reason to shame girls.
14. Wright et al. (1989), concluded from a quantitative study, that shame has a higher correlation to depression than guilt and therefore assumed to be a deeper emotionally shaping experience in depression.
15. In a case study by Marie Wilson (2000), she argues that the creative process and the arts access a different cognition and allow sex addicts to heal from shame in a more organic assimilation of past experiences.
16. 53% of pastor's wives reported the emotion of shame as a consequence of their husbands sex addiction (King, 2003).
17. In a 2018 study by Gordon, the Male Sexual Shame Scale was shown to assess shame proneness appropriately.
18. Women did not talk about masturbation even when shameless about it according to a 2014 study by Fahs and Frank.
19. When people watched a video of males or females masturbating in combination with a research project by Mosher and Abromson (1977), people who reported masturbating most frequently reported the highest level of shame associated with the video of the males masturbating and the lowest level of shame associated with watching the video of the females masturbating.

## CITABLE UNITS ASSIGNMENT

20. A qualitative study in 2021 by Turner and Stayton suggests that sex therapy integrates spirituality is possible and helpful, but clinicians should be aware of religious and clergy-based shame.
21. Education about sexuality has been shameful and sent messages of muzzling to young women in the past. To counteract this, Gunning et al. (2020) recommend positive messages about sexuality in the future.
22. Shame does increase the frequency of use of pornography, but more than just shame mitigation for reduction of pornography use, clinicians should also consider how users cope with shame in other ways. According to Volk et al. (2019), these coping mechanism (especially shifting responsibility to others) contribute significantly to decreased therapeutic outcomes.
23. A study by Phillips et al. (2019) on the relationship between Self-Compassion Scale and the Hypersexuality Behavior Inventory showed that owning shameful emotions may precipitate a cycle of unwanted sexual behavior.
24. Mindfulness Based Relapse Prevention allows pornography users to live in the present and fight against ruminating on shame from past use Chisholm and Gall conclude in a 2015 meta-analysis of potential pornography addiction treatments.
25. When asking men about their communication about their pornography use, Sniewski and Farvid (2020) discovered that if men were met with what they perceived as a negative response to their disclosure, shame and secrecy increased.
26. There is evidence from a 2021 DeJong and Cook study showing that individuals who used pornography and believed religiously that pornography use was immoral were highly stressed because of this dissonance.
27. Pornography use among high-school aged adolescents was seen to increase self-objectification and body comparison but not seen to be associated with body shame according to a 2021 study by Maheux et al.
28. In a study comparing religious and non-religious men, Reid et al. (2016) found that there was no significant difference in the levels of shame experienced do to hypersexuality involving solo sex.
29. Any stigma culturally associated with working in the sex industry is not by means of association shameful according to a study by Sapous-Desyllas and Goulah-Pabst (2022).
30. In a 2021 qualittive study of young women and a rising sexual culture, Williams found that the level of shame brought on by sexual freedom was mediated by social class.
31. In a study of adults over the age of 65, Hardy et al. (2022) discovered that “disapproval and shame” were leading reasons these persons did not engage in sexually explicit

## CITABLE UNITS ASSIGNMENT

material online. The conclusion was that older adult culture is not open to exploring sexuality in this manner.

32. According to Adams and Robinson (2001), Sexual addiction results from early impaired bonds with attachment figures. This lack of secure attachment figures causes sexual development to be misguided through shame.
33. In a study of women with hypersexual behavior, no correlation was shown between religious belief (or lack of) and hypersexual behavior and/or the result of shame due to hypersexual behavior (Dhuffar & Griffiths, 2014).
34. A 1997 study of shame proneness confirmed an earlier hypothesis that male identity is molded more by guilt than shame and female identity is molded more by shame than guilt (Ferguson & Crowley).
35. Ferguson et al. (2000) were able to tie unwanted identities and shame proneness to anger activating anxiety.
36. Using religion to help cope with the trauma of sexual abuse can be either positive or negative. According to Ladis et al. (2022), coping positively with religion is associated with a lack of withdrawing due to shame.
37. Perry and Whitehead (2019) found that the degree of sexual satisfaction connected to pornography use was mitigated to a greater degree by the shame surrounding spiritual dissonance than around the act of viewing pornography itself.
38. Despite the shame it induces and the cognitive dissonance it incites, religious men are just as likely to view pornography against their strong moral stand as non-religious men (Perry, 2018).
39. Participants in convenience samples across a qualitative study were seen to experience greater shame over hypersexual behavior when their religious views called for this behavior to be a severely immoral act (Karaga et al., 2016).
40. According to a 2014 study of college students by Giordano and Cecil, students who reported lower levels of spirituality reported higher levels of hypersexuality, leading the researchers to claim lower levels of spirituality is a predictor of hypersexuality among college students.
41. Shame was proven to be a positive predictor of hypersexual behavior in a study of pornography users already in treatment for hypersexuality (Gilliland et al., 2011).
42. According to Dhuffar et al. (2015), shame, and other distressful emotions, can be positively associated with hypersexual disorder.

## CITABLE UNITS ASSIGNMENT

43. Individuals with hypersexuality disorder use withdrawal and negative self-criticism when attempting to counteract shame (Reid et al., 2009).
44. Reid et al. (2011) confirmed through additional quantitative measures that shame and other stressful emotions were connected to coping with hypersexuality.
45. The guilt individuals feel over watching pornography was seen to be associated with the resulting emotion of shame in a two-study research project conducted by Sassover et al. (2021).
46. In a study by Talbot et al. (2004), shame-proneness was a contributing factor in dissociation among women hospitalized for trauma treatment. Surprisingly, childhood sexual trauma was not a contributing factor to dissociation in and of itself. When analyzed, the two factors did combine to predict dissociation.
47. Straub et al., (2018) concluded that women who identified as other than heterosexual and believed that society held a negative view of their sexuality and were recovering from trauma had a greater tendency toward shame and withdrawal.
48. Posttraumatic stress disorder symptom persist along a 6 year longitudinal study of childhood sexual trauma victims when shame in the victims over the abuse is high (Feiring, & Taska, 2005).
49. In a Slovakian study, shame proneness was associated with a more conservative view of dating relationships that went outside the traditional dyadic couple (Kaplánová & Gregor, 2019).
50. A 2013 quantitative study reasoned that targeting stigmatizing beliefs about one's sexual identification could help reduce the amount of shame in clients who identify as other than heterosexual (Johnson & Yarhouse).
