

Journal Notes Assignment for 870

(research questions/s, methodology, discussion, limitations, future work, etc.)

[to explore and describe the meaning of the experience of newly licensed counselors' attunement with their supervisors, whom they perceive as securely attached to God]

"What are supervisees' lived experiences of attunement with supervisors who demonstrate strong God attachment?"

Supervisory Relationship

1. Wilson, H. M., Davies, J. S., & Weatherhead, S. (2016). Trainee therapists' experiences of supervision during training: A meta-synthesis. *Clinical Psychology & Psychotherapy*, 23(4), 340-351.

- Methodology: Meta-synthesis of 15 qualitative studies
- Research question: What is the experience of counseling trainees concerning the efficacy, importance, and quality of supervision?
- Discussion: Participants reported their experience of supervision and what was helpful about their experience.
- Limitations: Did not consider differing psychological approaches, some specific aspects of supervision (including cultural aspects) could have been over-weighted.
- Future research: Did supervision address the supervisee's competence, supervision of the supervisor, how do trainees navigate negative experiences, evaluating supervisors, and helping trainees address negative experiences.
- Citables:
 - Using Herm Phen allows the researcher to access the co-researcher's individual experience and the collective experience of all participants.

- Researchers have a conscious experience of the phenomenon they are studying.
- Supports a design that seeks to interpret the meaning of the phenomenon.
- Allows the researcher's lived experience to be included in the meaning-making/data analysis.

2. Ertl, M. M., Ellis, M. V., & Peterson, L. P. (2023). Supervisor Cultural Humility and Supervisee Nondisclosure: The Supervisory Working Alliance Matters. *The Counseling Psychologist*, 51(4), 590–620. <https://doi.org/10.1177/00110000231159316>

- Research question: Why do supervisees withhold important information in supervision? Specifically “The present study is the first to test whether supervisor cultural humility was inversely related to supervision-related and clinically-related supervisee nondisclosure among supervisees, as well as whether the supervisory working alliance (assessed according to Bordin’s [1983] conceptualization of supervisees’ self-reported perceptions of emotional bonds and agreements on goals and tasks) would mediate hypothesized links between supervisor cultural humility, collaborative supervision, and supervisee nondisclosure.”
- Methodology: Based on multivariate multiple regression with three independent variables and two dependent variables
- Discussion:
 - Showed a reluctance to disclose negative experiences due to power, safety and evaluation.
 - No issues disclosing positive experiences.

- Working alliance may be a mediator
- Strong working alliance may support positive outcomes
- Limitations:
 - 25% did not complete and the differences in experiences are unknown and not generalizable.
 - Too homogeneous.
 - Cross-section measured at a one-time point and mediation is not well tested.
- Future research:
 - Dyadic studies to evaluate cultural humility
- Citable:
 - Supervisory alliance, as a part of the supervision relationship, is an essential factor in the positive outcome of supervision.
 - Supervisee disclosure occurs more often when the supervisory relationship is collaborative.

3. Teichman, Y., Berant, E., Shenkman, G., & Ramot, G. (2023). Supervisees' perspectives on the contribution of supervision to psychotherapy outcomes. *Counselling and Psychotherapy Research*, 23(2), 516–529. <https://doi.org/10.1002/capr.12540>

- Research question: What is the supervisees' experience of the contribution of the supervisory bond (SB) and didactic input of the supervisor (DI) to the agreed-upon outcome of therapy?
- Methodology: mixed method; supervisory aspects qual, contributions quant.

- Discussion: Age, supervision status, and supervision frequency accounted for 24% of the variance. SB and DI accounted for 51% of the variance. DI produced more quality themes than SB. Sociodemographic and supervisory variables do contribute to supervisees' evaluation of outcomes.
 - Limitations: not culturally sensitive enough, gender matching was not included, did not address length and frequency of supervision.
 - Future research: How do theoretical differences impact the variance? Longitudinal study of self-awareness and client understanding themes as they impact of therapy. Meaning supervisees' attribute to theoretical training.
 - Citable:
 - Supervisees reported feeling the ability to develop personal and professional competencies when they sensed their supervisor was holding them, helping them have a secure base.
4. Paunov, T., Weck, F., & Kühne, F. (2025). "Now we can think about it together" – A thematic analysis of what characterizes (in)effective supervision sessions for novice CBT supervisees. *Psychotherapy Research*, 1–13.
- <https://doi.org/10.1080/10503307.2025.2569042>
- Methodology: Thematic analysis of 9 effective and 7 ineffective supervision sessions. Effectiveness was based on independently assessed competence and alliance scores pre-post session.
 - Research question: What are the key processes that support skill development in novice CBT supervisees?

- Discussion: 4 themes arose: “Shaping Supervision through Supervisee Agency, The Supervisor as a Tailor, Co-Constructing Supervision, and Creating a Space to Learn”. “Effective supervision sessions were characterized by supervisees working actively on their individual goals, the use of a variety of supervisory techniques tailored to the supervisees’ needs, a collaborative exchange at eye level, and a supportive and empowering atmosphere.”
 - Limitations: supervisees in early stages of CBT training, experimental training and not to therapy sessions limiting generalizability, setting was artificial and could suggest findings that are not generalizable to other settings, the definition of effective and ineffective supervision, the thematic analysis was conducted by a single researcher.
 - Future research: other potential definitions for effective and ineffective supervision and use other indices to select statistically significant change in skills after supervision.
 - Citable:
 - Supervision is not a one-size-fits-all template.
 - Supervision should be supportive, foster agency, offer feedback, and be genuine.
5. Watkins, C. E. (2020). What do clinical supervision research reviews tell us? Surveying the last 25 years. *Counselling & Psychotherapy Research*, 20(2), 190–208.
<https://doi.org/10.1002/capr.12287>
- Research question: What do clinical supervision research reviews over the last 25 years tell us?
 - Methodology: systematic research review of systematic research reviews. Inclusion criteria were 1. Peer reviewed, 2. In English. PRISMA was used in five reviews, a

research protocol was registered for three cases, for the remainder, critical appraisal skills programme, weight of evidence approach were applied to the studies.

- Discussion: 3 categories, 1. Supervision can have positive or negative impacts but is mostly seen as helpful, 2. No clear evidence supports any given model of supervision, 3. There are consistent methodological issues with all studies. Supervision has many problems, is not empirically studied, and has not changed in 25 years.
- Limitations: single author and trustworthiness is questioned, inclusion/exclusion criteria in question, small sample size (20 reviews), low researcher bracketing.
- Future research: study the supervisory process, less biased studies, evidence-based research on what works in supervision relationships.

6. Chircop Coleiro, A., Creaner, M., & Timulak, L. (2023). The good, the bad, and the less than ideal in clinical supervision: a qualitative meta-analysis of supervisee experiences. *Counselling Psychology Quarterly*, 36(2), 189–210.

<https://doi.org/10.1080/09515070.2021.2023098>

- Research question: What aspects do trainees experience as helpful and unhelpful in individual clinical supervision?
- Methodology: qualitative meta-analysis
- Discussion: the quality of the supervisory relationship is the largest impact on what is experienced as helpful or unhelpful, formal training and supervision in supervision impact the focus as well, supervisors should be respectful of supervisees needs, supervisors should remain open and flexible in their approach,

- Limitations: the clustering of similarities in QMA may overlook nuances of individual studies, results are colored by the primary researcher's interpretation, not all studies had the same focus of helpful and unhelpful aspects of supervision, the impact of smaller samples sizes may have conflated the QMA results, the quality of the QMA is contingent upon the quality of the primary studies,
- Future research: Supervisor training to evaluate competence to provide supervision, more minority voices should be included, how experiences in different stages of training impact the focus
- Citables:
 - Supervision has many interpersonal benefits as well as professional benefits.
 - Not all supervision is equal, inadequate supervision can cause as much harm as supportive supervision has benefits.

7. Hiebler, R. M., Nausner, L., Blaha, A., Grimmer, K., Korlath, S., Mernyi, M., & Unterrainer, H. F. (2021). The supervisory relationship from an attachment perspective: Connections to burnout and sense of coherence in health professionals. *Clinical Psychology & Psychotherapy*, 28(1), 124–136. <https://doi.org/10.1002/cpp.2494>

- Research question: What is the importance of the supervisory relationship for the professional's performance and the well-being of the supervisee?
- Methodology: Cross-sectional observational study
- Discussion/Citables: Previous research showed the importance of the supervisor providing a secure base for the supervisee to support curiosity, flexibility, and growth

(Kurtz, 2005). Attachment theory can provide a helpful framework for understanding supervisors support of the supervisee's well-being, more study is necessary however.

- Attachment styles determine connection to some degree
- Connection, supervisor to supervisee, leads to low burnout and high coherence
- Limitations: self-report measures, cross-sectional design including multiple types of health professionals, 35% of participants were supervisors,
- Future research: Underlying attachment parameters in relation to the well-being of supervisees, longitudinal research on attachment theory and supervision

8. Rønnestad, M. H., Orlinsky, D. E., Schröder, T. A., Skovholt, T. M., & Willutzki, U. (2019). The professional development of counsellors and psychotherapists: Implications of empirical studies for supervision, training and practice. *Counselling and Psychotherapy Research.*, 19(3), 214–230. <https://doi.org/10.1002/capr.12198>

- Research question: What is normative development for counselors and therapists?
- Research method: mixed
- Citables:
 - predominantly healing environments and limited stressful environments in practicum are required for effective development.
 - Students should be exposed to client work as early as possible
 - Supervision ranked among the two most influential factors in counselor development over life-span
- Limits: studied clinicians and students in a specific time frame
- Future: longitudinal studies of development

9. Norcross, J. C., & Lambert, M. J. (2018). Psychotherapy relationships that work III. *Psychotherapy*., 55(4), 303–315. <https://doi.org/10.1037/pst0000193>

- Question: What specifically is impactful in the powerful psychotherapy relationship?
- Method: met-analysis
- Citables:
 - Not directly related to supervision, but my inference is that we need to train for these 9 attributes if the therapeutic relationship makes this much difference.
 - 9 attributes of the therapeutic relationship that continue to point to the importance of the relationship.
- Limits: single task force, neglected the client's contribution to therapy, limited to Western developed nations, difficulty connecting causal connections between relationship behavior and treatment outcome.
- Future: examine the interrelatedness of the elements of relationship

10. Flasch, P., Ohrt, D. L., Fox, J., Ohrt, J. H., Crunk, E., & Robinson, E. (2019). Experiences of Altruism in the Therapeutic Relationship: Perspectives of Counselors-in-Training and their Clients. *Counseling and Values*., 64(2), 168–185. <https://doi.org/10.1002/cvj.12113>

- Question: what are the experiences of altruism in the therapeutic relationship as perceived by CIT's and clients
- Method: Phenomenological
- Citables:

- some support for the influence of altruism between CIT's and their clients
- closely related to qualities of a relationship
- this study showed altruism moved beyond understanding and connectedness to behavioral manifestations that signaled its presence
- clients identified its presence as influential
- making a client feel valued, listening attentively, refraining from judgement, remembering details from sessions, and attending to individuals in a family all prove important to the therapeutic relationship and should be taught as inclusions of therapy.
- Limits: topic influenced who participated, limited depth and breadth by construction of questions, deviated from traditional phenomenological research with deductive content analysis, with respect to the participants
- Future: expand sample to include licensed counselors, quantitative study that between altruism and other constructs

11. Rothwell, C., Kehoe, A., Farook, S. F., & Illing, J. (2021). Enablers and barriers to effective clinical supervision in the workplace: a rapid evidence review. *BMJ Open.*, 11(9). <https://doi.org/10.1136/bmjopen-2021-052929>

- Question: What are the enablers and barriers to effective clinical supervision in the workplace?
- Method: Rapid Evidence review
- Citables:

- Enablers include consistency, privacy, flexibility, positive relationship and mutual trust, supervisee should be given a choice of supervisor, cultural understandings should exist, shared understanding of purpose, individual needs of supervisee, focus on enhancing skills and knowledge to support professional development
- Limits: papers were limited to Western only in the past ten years, not enough attention to study design and sample size, overly heterogeneous
- Future: study different types of supervision with different types of people, role of training in the enablers?

12. Eubanks, C. F., Muran, J. C., & Safran, J. D. (2018). Alliance rupture repair: A meta-analysis. *Psychotherapy*, 55(4), 508–519. <https://doi.org/10.1037/pst0000185>

- Question: How are therapists' ability to address alliance ruptures and repairs related to treatment outcomes and mediated by supervision/training?
- Method: meta-analysis
- Citables:
 - Relationship with supervision was unremarkable, but greater with patients without a personality disorder or when training was aligned with CBT more than psychodynamic, and when treatment was brief.
- Limits: small sample size,
- Future: longitudinal studies or studies that measure ruptures and repairs over multiple phases of treatment

13. Vallance, K. (2004). Exploring counsellor perceptions of the impact of counselling supervision on clients. *British Journal of Guidance & Counselling*, 32(4), 559–574.

<https://doi.org/10.1080/03069880412331303330>

- Question: What are the counselors’ experience and perceptions of how counseling supervision impacts their clients?
- Model: Phenomenological
- Citables:
 - Little research in this area
 - The impact of supervision on clients is mixed; helpful and unhelpful
 - Most direct impact: “exploration of client-counselor dynamics and raising counselor self-awareness, professional development, emotional support, and the quality of the supervisory relationship.
 - “Congruence and confidence were the most direct link between supervision and client work.”
- Limits: no clear-cut cause-effect relationship between supervision and client outcome, sample-size limited, researcher bias is present, participants known to the researcher, limiting generalization.
- Future: parallel with client experience, wider range of counselors and diversity, impact on clients not taken to supervision

14. Jimenez Andujar, D. J. (2002). *Experiences of personal growth of master's -level supervisees within the supervisory process* (Order No. 3051351). Available from ProQuest Dissertations & Theses Global. (305570821).

<https://www.proquest.com/dissertations-theses/experiences-personal-growth-masters-level/docview/305570821/se-2>

- Question: How do master's level supervisees perceive their experience of personal growth in the supervision process?
- Method: Grounded Theory/Phenomenological
- Citables:
 - Feeling safe was an essential part of being vulnerable and open to change.
 - The most important attributes promoting personal growth were the personal and professional characteristics of their supervisor.
 - Role-modeling, collegiality, and competence were among the most important professional characteristics.
 - "being accepting, available, easy-going, and having a sense of humor" were the impactful personal characteristics.
- Limits: no attempt to quantify the growth, researcher subjectivity, concerns of anonymity may have limited disclosure.

15. Livni, D., Crowe, T. P., & Gonsalvez, C. J. (2012). Effects of supervision modality and intensity on alliance and outcomes for the supervisee. *Rehabilitation Psychology*, 57(2), 178–186. <https://doi.org/10.1037/a0027452>

- Question: What are the potential benefits of introducing a supervision program to alcohol and other drug workers in regard to burnout, well-being, and job satisfaction?
- Method: ANOVA
- Citable:

- The supervisory alliance was necessary to increase well-being and reduce burnout among participants; supervision alone was insufficient to effect change.
- Individual supervision resulted in greater relational alliance.
- Supervision effectiveness was predicted by alliance
- Limits: missing data, no independent control group, length of supervision, and frequency of supervision.
- Future: longitudinal study, assess alliance from the supervisors' perspective.

16. Bradley, W. J., & Becker, K. D. (2021). Clinical supervision of mental health services: a systematic review of supervision characteristics and practices associated with formative and restorative outcomes. *The Clinical Supervisor*, 40(1), 88–111.

<https://doi.org/10.1080/07325223.2021.1904312>

- Question: What are the supervision characteristics and practices associated with formative and restorative outcomes?
- Method: PRISMA
- Citables:
 - Role-play, discussing intervention, and corrective feedback were the most common practices for promoting formative outcomes.
 - Several supervision strategies have empirical support for promoting formative outcomes.
 - Empathy and praise were both identified in promoting restorative outcomes.
 - Prioritizing relationship factors remains important in restorative outcomes (provider well-being, burnout prevention, and job satisfaction).

- Limits: relying on a single coder's judgment, cross-sectional data limits causality, there was a "dearth of research" concerning "supervision practices and characteristics with normative outcomes".

- Future: more rigorous studies,

17. Lohani, G., & Sharma, P. (2023). Effect of clinical supervision on self-awareness and self-efficacy of psychotherapists and counselors: A systematic review. *Psychological Services.*, 20(2), 291–299. <https://doi.org/10.1037/ser0000693>

- Question: What is the impact of clinical supervision on supervisee self-awareness and self-efficacy?
- Method: PRISMA
- Citables:
 - Supervision's positive impact on supervisees' is that they grow and develop.
 - Counseling skills development, self-awareness development, and self-efficacy development are all outcomes of supervision.
 - Live supervision is preferred for its process-oriented factors and ability to provide immediate feedback and interventions.
 - The small number of studies that could be included indicates the limited research we have on the effects of supervision (and effective supervision).
- Limits: only one study included the techniques of clinical supervision, small scale studies, do not rule out environmental factors
- Future: well-researched and well-conducted qualitative research, the lack of research discovered by this study indicates the need for research of any kind on the effects of clinical supervision.

God Attachment/Attachment to God (ATG)

18. Njus, D. M., & Scharmer, A. (2020). Evidence that God Attachment Makes a Unique Contribution to Psychological Well-Being. *The International Journal for the Psychology of Religion*, 30(3), 178–201. <https://doi.org/10.1080/10508619.2020.1723296>

- Question: does God attachment uniquely contribute to psychological well-being?
- Method: ANCOVA
- Citables:
 - This study found that a secure God attachment, independent of adult attachment style, can account for psychological well-being.
 - Kirkpatrick first used Answorth and Bowlby's ideas of attachment to state that an individual's attachment to God (even if it is only seen as a psychological attachment) could serve as a secure base for them to take risks in an unsafe world.
 - Secure attachment has a number of positive outcomes, including but not limited to, positive affect and self-esteem.
 - God attachment makes a unique contribution to psychological well-being
- Limits: no random selection, all participants self-identified as Christian, all studies utilized correlation methodology.
- Future: longitudinal studies examining relationships between attachment and well-being.

19. Facchino, A. P., D'Ettorre, M., Verrocchio, M. C., Fontanesi, L., & Marchetti, D. (2025). Attachment to God and positive orientation: A systematic review. *Archiv Für*

Religionspsychologie = Archive for the Psychology of Religion.

<https://doi.org/10.1177/00846724251338431>

- Question: what are the gaps in research concerning the relationship between attachment to God (ATG), positive orientation, and its indicators?
- Method: PRISMA
- Citables:
 - Significant associations were present
 - Secure ATG was associated with one or more dimensions of positive orientation
 - Positive orientation – the propensity to think positively about the future
- Limits: overly heterogeneous, presence of uncontrolled variables, predominance of Christian participants.
- Future: assess positive orientation as a unified construct using specific instruments

20. Keefer, L. A., & Brown, F. L. (2018). Attachment to God Uniquely Predicts Variation in Well-Being Outcomes. *Archiv Für Religionspsychologie = Archive for the Psychology of Religion.*, 40(2–3), 225–257. <https://doi.org/10.1163/15736121-12341360>

- Question: Are the associations between God Attachment and well-being due to the unique nature of that bond, or are they merely due to the incidental overlap between human and divine attachment style?
- Method: cross-sectional survey of Quantitative, ANCOVA
- Citables:
 - Interpersonal attachments do not affect the association between ATG and well-being

- Personality differences do not account for variances in outcome measures.
- The current study supports ATG as a unique dimension of personality.
- Secure ATG is a unique contribution to well-being
- Limits: predominantly female sample, overreliance on the AGI measure, cross-sectional survey approach limits interpretation.
- Future: longitudinal study

21. Leman, J., Hunter, W., Fergus, T., & Rowatt, W. (2018). Secure Attachment to God Uniquely Linked to Psychological Health in a National, Random Sample of American Adults. *The International Journal for the Psychology of Religion.*, 28(3), 162–173.

<https://doi.org/10.1080/10508619.2018.1477401>

- Question: Does a perceived relationship to God account for variation in psychological distress and well-being?
- Method: Hierarchical regression
- Citables:
 - ATG dimensions account for unique variability in reported psychological well-being
 - Perceived relationship to God seems to be an important factor in connection to psychological health.
- Limits: generalizing findings from one religious denomination to broader populations and religious views, the dependent variable of study 2 comprises several items to measure psychological well-being, nature of self-report, the analysis cannot provide a clear picture of the causal relationship between ATG and well-being.

- Future: incorporate new well-validated measures of God concepts, more specific components of psychological health could be assessed, more diverse cultures and religious views included,

22. Henderson, W. M., & Kent, B. V. (2022). Attachment to God and Psychological Distress: Evidence of a Curvilinear Relationship. *Journal for the Scientific Study of Religion.*, 61(1), 161–177. <https://doi.org/10.1111/jssr.12767>

- Question: what is the relationship between ATG and psychological distress?
- Model: quantitative, curvilinear, OLS regression
- Citables:
 - Anxiety over one's relationship with God represents a threat to psychological well-being.
 - A secure attachment to God that positively contributes to one's psychological well-being was affirmed.
 - Anxious and avoidant ATG should not be characterized as linear, rather those with avoidant are more similar to those with a secure ATG
- Limits: mental distress may also cause the results seen, cross-sectional nature of the study, a predominantly Christian sample, results do not speak to clinically referred patients
- Future: compare different effects of different beliefs about the divine, the durability of attachment styles in different levels of distress across one's life, account for uncertainty in participants beliefs

23. Tung, E. S., Ruffing, E. G., Paine, D. R., Jankowski, P. J., & Sandage, S. J. (2018). Attachment to God as mediator of the relationship between God Representations and

mental health. *Journal of Spirituality in Mental Health.*, 20(2), 95–113.

<https://doi.org/10.1080/19349637.2017.1396197>

- Question: how are mental representations of God associated to mental health through ATG?
- Method: Structural Equation Modeling using AMOS 22 and Bootstrapping
- Citables:
 - ATG accounted for the positive relationship between benevolent God representations and mental health indicators
 - Higher scores on benevolent God representations predicted lower scores on insecure attachment to God.
 - Which predicted better mental health
 - The study supports ATG as a mediator of benevolent God representations and positive mental health
 - There was a negative association between mental health and benevolent God representations overall.
- Limit: predominantly white students associated with an evangelical-protestant university,
- Future: Include more heterogeneous sample of religious views, assess A/B Godscale, examine the possibility that ATG and God representations interact,

24. Ellison, C. G., Bradshaw, M., Kuyel, N., & Marcum, J. P. (2012). Attachment to God, Stressful Life Events, and Changes in Psychological Distress. *Review of Religious Research.*, 53(4), 493–511. <https://doi.org/10.1007/s13644-011-0023-4>

- Question: a longitudinal study to add to the data on the correlation between ATG and psychological distress
- Method: using longitudinal data: descriptive statistics followed by bivariate correlations followed by a series of regression models followed by OLS
- Citables:
 - Secure ATG is associated with decrease in distress over time
 - Secure ATG buffers against deleterious effects of life stress
 - Anxious ATG makes life stress worse
 - Secure STG is a more robust predictor of change in distress than other variables
- Limits: cross-sectional data make it impossible to determine the temporal order of key variables,
- Future: test other outcomes of psychological health

25. Jordan, K. D., Niehus, K. L., & Feinstein, A. M. (2021). Insecure Attachment to God and Interpersonal Conflict. *Religions.*, 12(9). <https://doi.org/10.3390/rel12090739>

- Question: What is the moderating effect of ATG on the relationship between self-control and negative social exchanges?
- Method: ANCOVA
- Citable:
 - Insecure ATG associated with hostile-dominant interpersonal style
 - Highest level of negative social exchanges occurred in individuals low in self-control and high in attachment avoidance and anxiety.
 - ATG may influence stress regulation

- Limit: cross-sectional data limits the temporal sequence of the variables, sample is Western evangelical
 - Future: include other variables to further study the effects of ATG on self-regulation
26. Miner, M., Dowson, M., & Malone, K. (2014). Attachment to God, Psychological Need Satisfaction, and Psychological Well-Being among Christians. *Journal of Psychology and Theology*, 42(4), 326–342. <https://doi.org/10.1177/009164711404200402>
- Question: Are relationships between insecure attachment to God, perceptions of basic needs met by God, and psychological symptoms better accounted for by the Attachment Security Primacy Model or the Need Satisfaction Primacy Model of attachment to God?
 - Method: SEM
 - Citables:
 - If one perceives God as able and willing to meet his/her needs, they will have a more secure ATG
 - Secure attachment predicts well-being in keeping with previous findings
 - Limits: study is not random nor heterogeneous as to Christian population and cannot be generalized to all Christians, window in time model
 - Future: alternative methods for measuring ATG, longitudinal study
27. Kent, B. V., Bradshaw, M., & Dougherty, K. D. (2016). Attachment to God, Vocational Calling, and Worker Contentment. *Review of Religious Research*, 58(3), 343–364. <https://doi.org/10.1007/s13644-016-0250-9>
- Question: Is ATG a secure base for people to find attachment to and therefore meaningful work mediated by a sense of calling?

- Method: Ordinary Least Square regression models
- Citables:
 - “Secure attachment to God does positively relate to commitment and job satisfaction.”
 - “Attachment style can be characterized as salient personal characteristics.”
Attachment style is a valid variable in why people act the way they do.
 - There is a meaningful connection to people’s beliefs about God and their satisfaction in their work, especially when they see work as a calling.
- Limits: the measure for ATG is a singular measure. Temporal precedent is impossible to see since the sample was cross-sectional. The data on the workplace of the participants is limited. Atheists are not included in the sample.
- Future: further research to substantiate these findings

28. Kent, B. V. (2017). Attachment to God, religious tradition, and firm attributes in workplace commitment. *The Journal of Social Psychology*., 157(4), 485–501.

<https://doi.org/10.1080/00224545.2016.1242470>

- Question: Does people’s ATG style have a relationship to people’s commitment to their workplace, and is this relationship moderated by the person’s firm attributes?
- Method: ANOVA
- Citables:
 - Catholics have higher levels of commitment to their workplace than evangelicals.
 - Firm size significantly moderates the relationship between ATG and commitment.

- Firm attributes describes the kind of place people work. Small organization vs large organization. Locally vs nationally owned. Private vs public. Etc.
- Limits: the cross-sectional nature means that temporal precedent is in question, and linear causality cannot be proven without question, lack of explanatory mechanisms for the difference between Catholics and evangelicals, lack of clear measures for ATG as a unique domain over adult attachment
- Future: supply measures to separate ATG from adult attachment domains, apply attachment domains from the BRS3 to other workplace outcomes (maybe effective supervision?)

29. Cherniak, A. D., Mikulincer, M., Shaver, P. R., & Granqvist, P. (2021). Attachment theory and religion. *Current Opinion in Psychology.*, 40, 126–130.

<https://doi.org/10.1016/j.copsyc.2020.08.020>

- Question:
- Method: Literature Review
- Citables:
 - There are multiple relationships between ATG and the way we believe and the religious and spiritual values we hold.
 - ATG is a secure base for regulating our adult attachment.
 - It is a valid framework for conceptualizing the differences in people's religious views and values
- Gaps:
 - How is ATG formed?

- How is perceived separation from God formed?
- What are the normative aspects of ATG?

Attunement/Effective Supervision

30. Shaffer, K. S., & Friedlander, M. L. (2017). What do “interpersonally sensitive”

supervisors do and how do supervisees experience a relational approach to supervision?

Psychotherapy Research, 27(2), 167–178.

<https://doi.org/10.1080/10503307.2015.1080877>

- Question: What do interpersonally sensitive supervisors do in session to enhance the supervisory relationship and contribute to a supervisee’s positive experience of supervision?
- Method: Confirmatory factor analysis/ simple mediation model
- Citables:
 - This research shows that attunement among supervisees whose supervisors use more interpersonally relational approached to supervision report a higher degree of alliance or attunement.
 - Shaffer and Friedlander’s research suggests that supervisees whose supervisors are more interpersonally relational report a higher degree of alliance or attunement.
- Limits: participants recall, nonrandom selection, not generalizable to post-graduate supervision, temporal precedence not accounted for
- Future: **are there exceptional supervisors who use relatively more relational behaviors?**

31. Talia, A., Muzi, L., Lingiardi, V., & Taubner, S. (2020). How to be a secure base: therapists' attachment representations and their link to attunement in psychotherapy.

Attachment & Human Development, 22(2), 189–206.

<https://doi.org/10.1080/14616734.2018.1534247>

- Question: Are therapists' attachment classifications linked to different types of therapists' attunement in session?
- Method: content analysis and ANCOVA
- Citables:
 - Independent of client characteristics, therapists' attachment frame accounted for differences and variability in attunement with clients over time.
- Limits: too heterogeneous as to therapists' developmental stage, specific to psychodynamic psychotherapy
- Future: Classify the measure and account for the limitations

32. Sant, M., & Milton, M. (2023). "Being affected by the other": psychodynamic supervisors' experiences of supervisory countertransference. *Psychodynamic Practice*, 29(4), 362–387. <https://doi.org/10.1080/14753634.2023.2228798>

- Question: How do psychodynamically-oriented supervisors experience supervisory transference?
- Method: Interpretive Phenomenological Analysis
- Citables:
 - 5 Themes: the complexity, its about the supervisee, is it about myself? What the supervisor brings, the quality of the supervisory transference, and supervisory ruptures

- Feedback from colleagues can help facilitate and make sense of supervisory countertransference (SCT).
 - Awareness of and the ability to attend to supervisory countertransference is a recommended competency within the field.
 - There is a difference between parallel process and SCT and the two should be differentiated when appropriate.
 - Negative SCT experiences can have an impact on and even sever the relationship.
 - Vulnerability related to SCT can be a thin line to walk; sometimes eliciting vulnerability, sometimes eliciting manipulation.
- Future: look into differences in diversity, such as religion. Explore the impact of premature termination.
 - Limits: researcher has no experience supervising, Participants were aware that the research was for the researchers dissertation, low disclosure on personal issues. As a phenomenological study, interpretations may vary.

33. Darka Kovič & Aisling McMahon. (2023) Building trust: supervisees' experience of power dynamics in transdisciplinary workplace supervision. *Journal of Social Work Practice* 37:4, pages 403-417.

- Question: What is the lived experience of power dynamics for supervisees attending transdisciplinary workplace supervision?
- Method: Interpretive Phenomenological Analysis
- Citables:

- 3 themes: struggling to find my place in the organization, navigating through vulnerability, and clicking into relationship.
- When feeling vulnerable, supervisees protected themselves by withholding information.
- Feeling vulnerable meant being the “less powerful one”.
- “All reported feeling empowered when they felt safe, valued, and respected as clinicians and supported by their supervisors.” P. 410 [this is a good starting point for an argument for ATG in supervision]
- This and previous studies reveal the importance of the supervisory relationship regarding the level of vulnerability and disclosure the supervisee felt comfortable with.
- Limits: insights from one primary mental health context, qualified, female supervisees, senior grade clinicians,
- Future: other contexts, relational dynamics in supervision, open communication of emotional experiences

34. Apostol, A. E., Turner, K., Hoshi, R., & Pudduck, A. (2025). Contributory Factors to Self-Disclosure in Clinical Supervision: A Meta-ethnography. *Clinical Psychology & Psychotherapy*, 32(2). <https://doi.org/10.1002/cpp.70068>

- Question: What are the factors that facilitate or prevent supervisees’ self-disclosure in clinical supervision?
- Method: Meta-ethnography
- Citables:

- 3 themes arose: Supervisory factors such as power differentials, personal characteristics, and supervision approach; contextual factors such as perceived repercussions, client-related issues, and stage of supervisee development; and supervisee factors such as communication problems, supervisory relationship, emotional impact, and impression management.
- Supervisors play a crucial role in whether supervisees disclose clinically important information about themselves or the client.
- Cultivating trust, improving communication, and supporting supervisees' emotional well-being all contribute to supervisee disclosure.
- Limits: different methodologies in the various studies included, the chronological organization was implemented late in the process and an earlier implementation could have shed light on the development of thought, limited consideration of ethical and professional guidelines,
- Future: diversity of supervisees and delve into individual experiences,

35. An, H.Y., Goodyear, R.K., Seo, Y.S. *et al.* Supervisor style as a predictor of counseling supervision relationship quality and supervisee satisfaction: perceptions of U.S. and South Korean supervisees. *Asia Pacific Educ. Rev.* **21**, 487–504 (2020).

<https://doi.org/10.1007/s12564-020-09637-x>

- Question: “Are certain supervisor styles more effective in contributing to counseling supervision process and outcome than other supervisor styles? What are the possible mediating roles of supervisory alliance and supervisee nondisclosure on the relations between supervisor styles and supervisee satisfaction?
- Method: SEM multigroup analysis

- Citables:
 - Supervisors in the US and SK should hone the skills necessary for a strong alliance for effective supervision.
 - Strengthening the working alliance has a positive effect on outcomes.
 - “Attractive, interpersonally sensitive, and collaborative supervision styles positively influence process and outcome variables.”
- Limits: study relied on self-report of memory,
- Future: include additional cultures

Effective Counselors

Tugendrajch, S. K., Sheerin, K. M., Andrews, J. H., Reimers, R., Marriott, B. R., Cho, E., &

Hawley, K. M. (2021). What is the evidence for supervision best practices? *The Clinical Supervisor*, 40(1), 68–87. <https://doi.org/10.1080/07325223.2021.1887785>

- Question: What current supervision practices are supported by empirical evidence?
- Method: PRISMA
- Citables:
 - This study reported that more research is needed to articulate what aspects of supervision produce effectiveness in counseling more clearly.
- Limit: single coder, limited to extant research, only explicit supervision characteristics could be coded
- Future: a more rigorous systematic review is needed

Methodology

Prosek, E. A., & Gibson, D. M. (2021). Promoting Rigorous Research by Examining Lived Experiences: A Review of Four Qualitative Traditions. *Journal of Counseling and Development.*, 99(2), 167–177. <https://doi.org/10.1002/jcad.12364>

- Question: How appropriate are qualitative research methods for studying counseling phenomenon?
- Method: qualitative meta-review
- Citables:
 - Lived experience studies are valuable but could be made better by paying attention to coherence across topic, paradigm, tradition, and results.
 - Focus on key elements of qualitative approaches, such as exploration of researcher bias and trustworthiness strategies when evaluating rigor.
 - Have conversations over preconceived limitations in the boundaries of design and the effectiveness of interventions and outcome research.
- Limits: limited by the original research
- Future: as this was a review of methods offering recommendations, the whole of the article is about the future of qualitative research, specifically phenomenological studies.

Epistemology

GAPS

- The stable nature of ATG
- Seems to be no research on supervisory attunement.
- Interesting that attunement is seen in conjunction with attachment theory.
- Relational dynamics in clinical supervision
- How to encourage disclosure of emotional experiences in supervision

- What are the individual experiences of supervisees' attunement to supervisors and the willingness to disclose?
