Stages of Group: Identification

512 INTENSIVE
NOV 13-17, 2023
RAY WAGONER

Objectives:

1. Identify the characteristics of the stages of groups.
2. Understand some key representations of these characteristics.

Introduction

- ♦ How do we know what type of tree we are looking at?

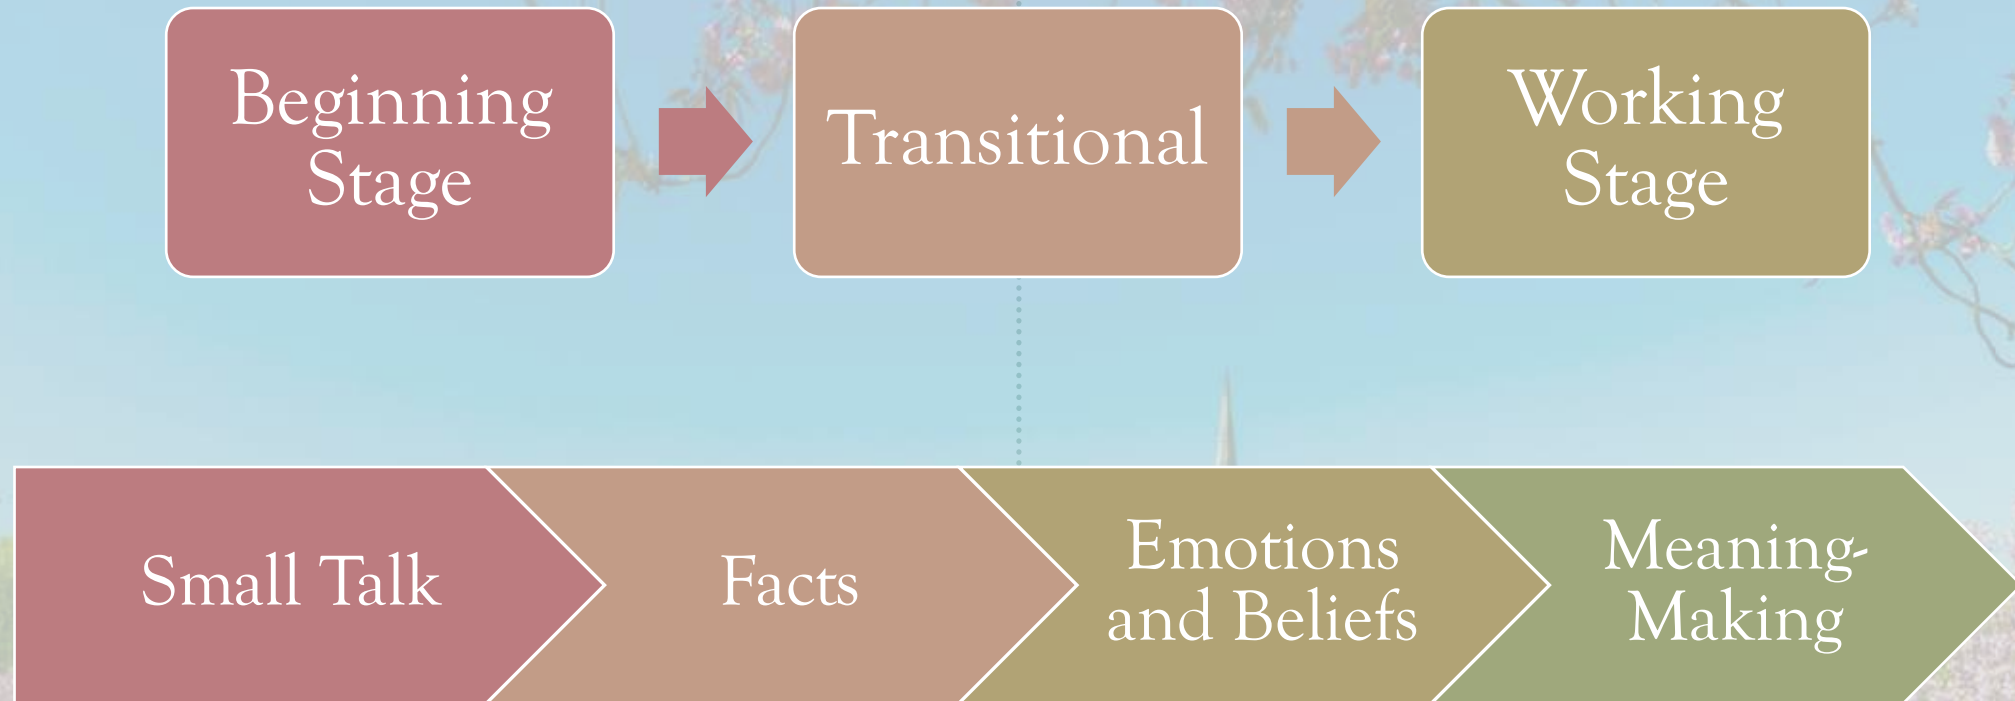

Introduction

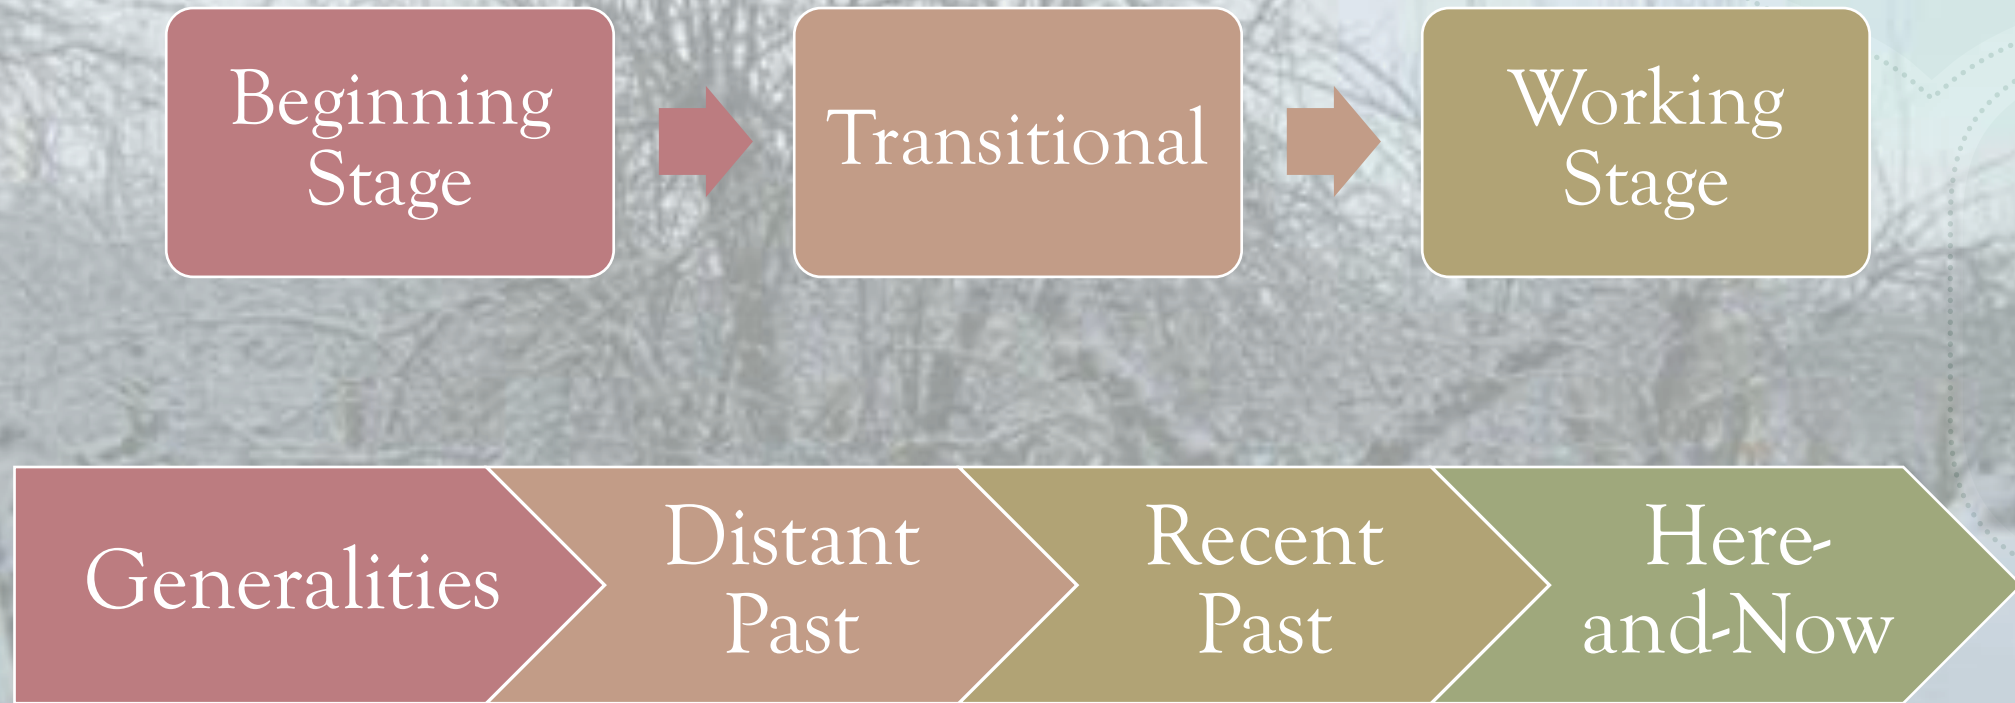

- ♦ How do we know what type of tree we are looking at?
- ♦ The bark
- ♦ The leaves
- ♦ The size
- ♦ The fruit
- ♦ But we also consider the season!

Self-Awareness

What are some of
your bucket list items?

Self-Awareness

Beginning
Stage

Transitional

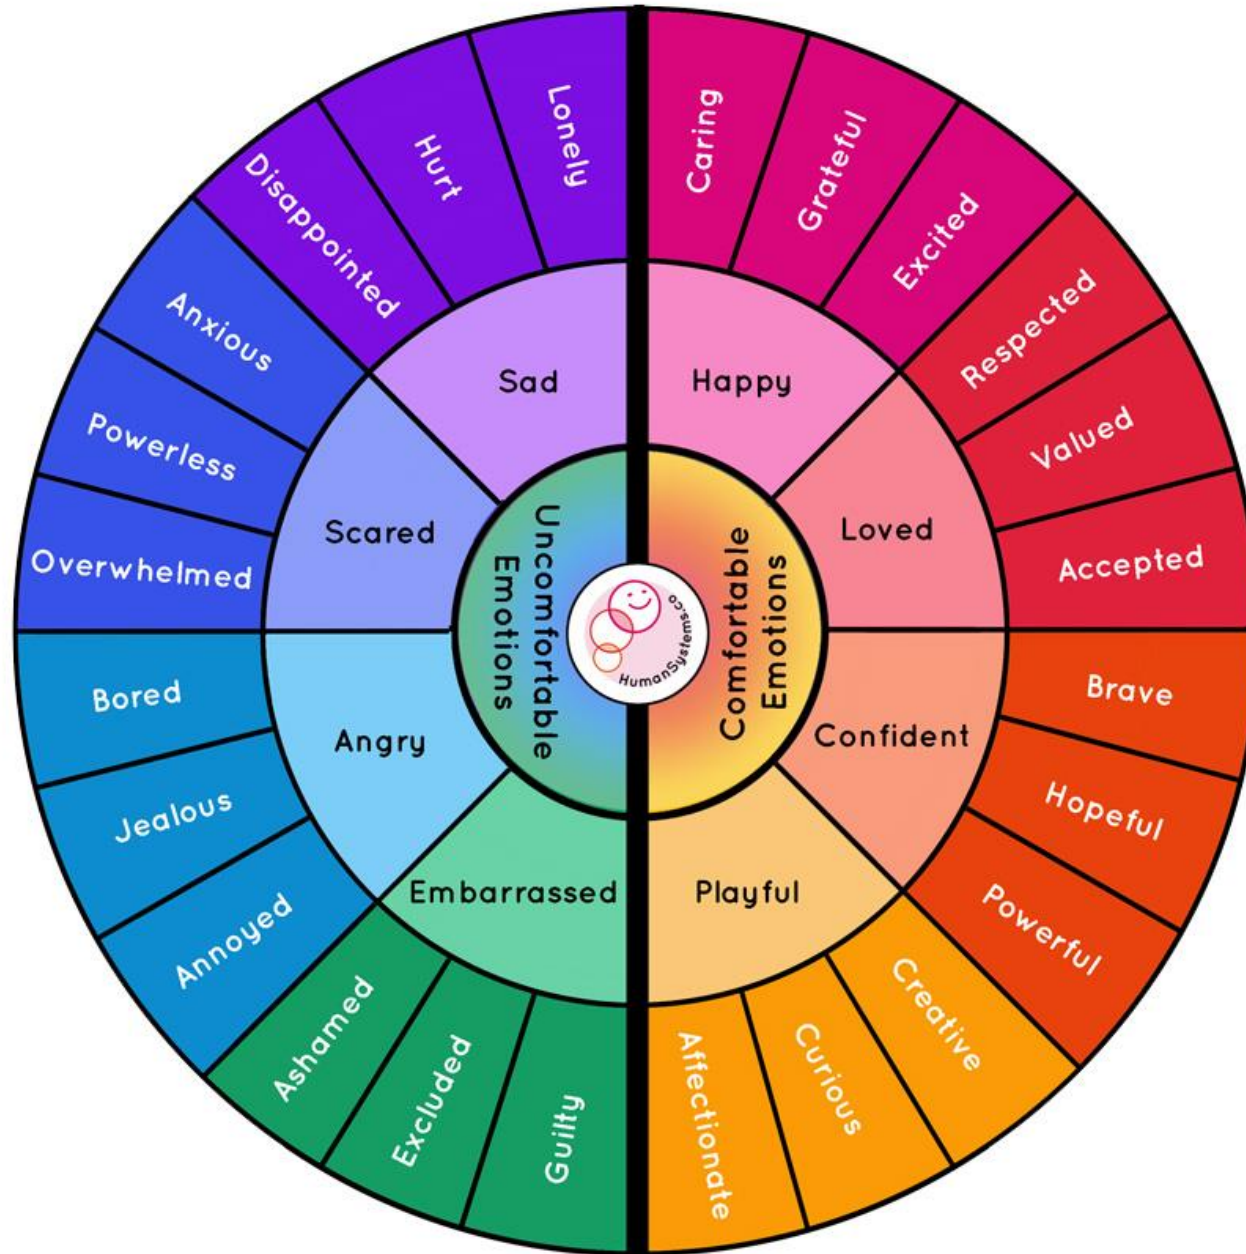

Working
Stage

Not listening to self
Unaware of feelings,
thoughts, reactions.
Attempt to repress
feelings & reactions.

Constantly aware of in
the moment feelings,
thoughts, reactions.
Able to access meaning
making

Emotion Wheel I

Openness to Self

Beginning
Stage

Transitional

Working
Stage

Speaks in generalities
Speaks about abstract ideas,
others outside of group
Intellectualizes
Dismisses feelings as
irrelevant

Talks specifically & focuses
on self
Includes feelings &
meanings

adrift on
We are in a treacherous sea of data. We have the ability to observe, dissect and analyse our web traffic like never before. We can compare traffic over time, we can break down estimates of visitor geography, we can *even* spy bursts of traffic from incoming links, tracing their sources and watch the dissemination of our content around the web.

Advertising platforms allow us to monitor impressions and click-through rates; on some platforms we can target by age, income, gender, even marital status. We can see bounce rates, repeat visitors, *and* track the exact path of visitors through our sites. Statistics are, however, famously deceptive.

all the things
The methodologies behind these technologies are rarely examined in detail and it is easy to forget just how much we cannot measure, including often the things that matter the most.

over and above things we can't
There is a tendency to place importance on things simply because we can measure them. Yet often the easiest metrics are in fact the least important. Imagine for a second you run an art gallery – would you prefer to be *over-run* by hundreds of teenagers, or visited by a small group of corporate art buyers? Yet online, we rarely differentiate between valuable and worthless.

Obviously you'd be likely to gain more from the serious buyers.

traffic. Aggregators such as StumbleUpon and Boing Boing can drive incredible traffic numbers but what precisely is the value of that traffic?

Just as the Internet can do large numbers it can also do incredibly small ones, the nature of conversion rates online is often to be talking about digits only to the right of the decimal place. The question of which audience matters is by its very nature a qualitative measure, yet it is *but an* incredibly important one.

Recently Twitter did an analysis of the *viral* explosion of a meme (bit.ly/hSgHza) around their network, #LessAmbitiousFilms. The analysis revealed that the *meme's popularity exploded* real explosion happened not when it was retweeted by a celebrity with over 5 million followers but when it was retweeted by two users with around 15-20,000 users.

celebrity's X year
Those two had a fraction of the audience but they were the right audience, turned in, on the same wavelength and receptive to the content. It wasn't the size of the audience that mattered, it was the ephemeral nature of who they were that made the difference.

each? between them?
How does this relate to an online business? To improve a website you need empirical measurements you can use to define success and improvement.

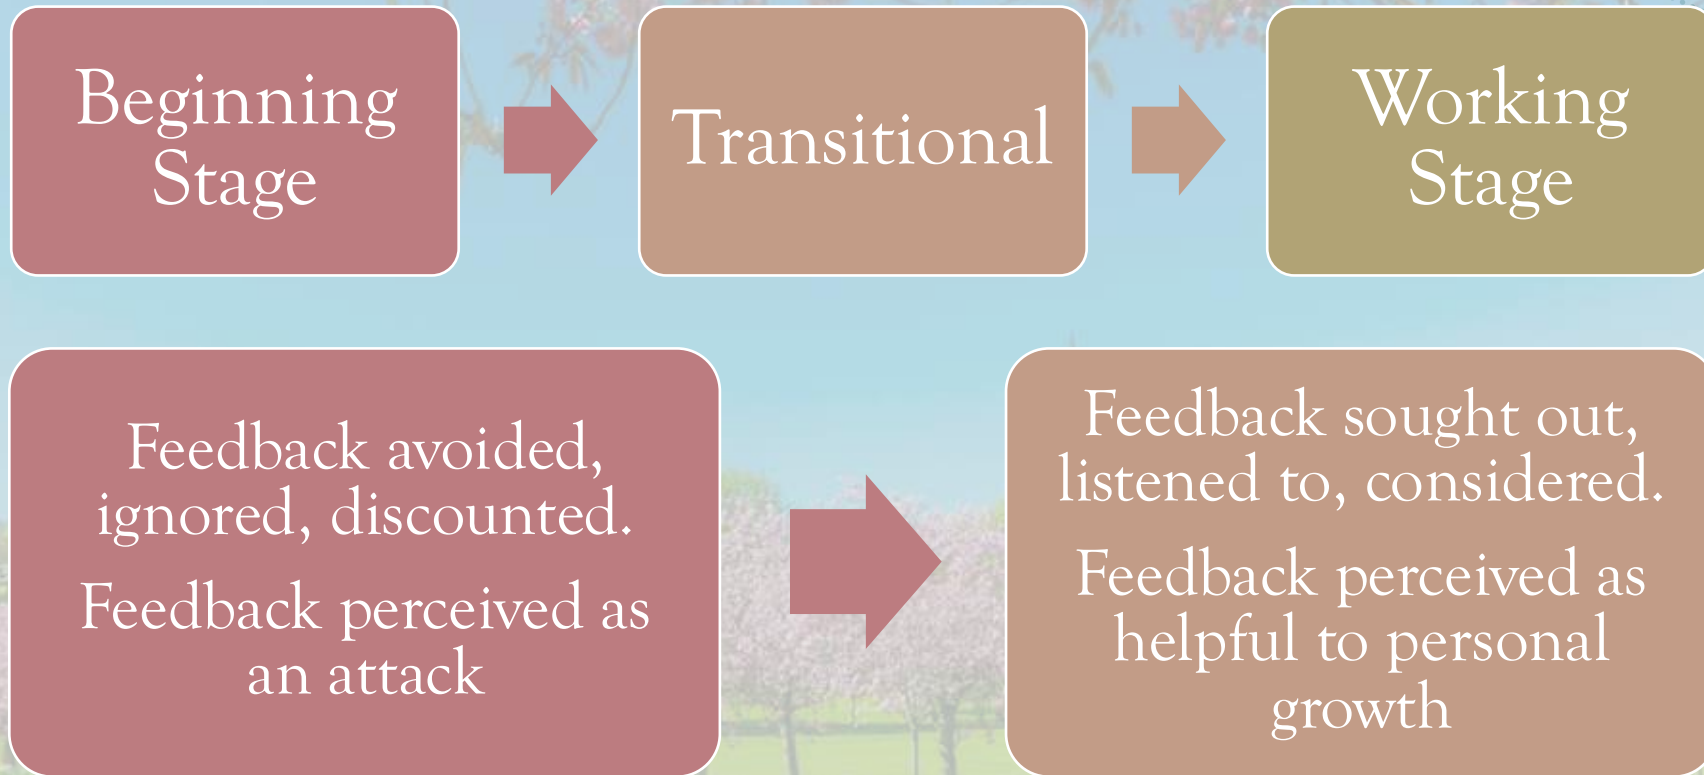

Without consistent metrics you're flying blind. If you choose the wrong metrics you're going to be *heading into* steering toward a nose-dive. If your goal is to sell more product online the key metric is raw sales, *and* your derivative metrics might be average order size and frequency of re-order.

If, however you look at overall website traffic, or worse yet, assume there should be some kind of relationship between traffic levels and sales, you could end up thinking your website is failing even as the things that matter most to your business are improving.

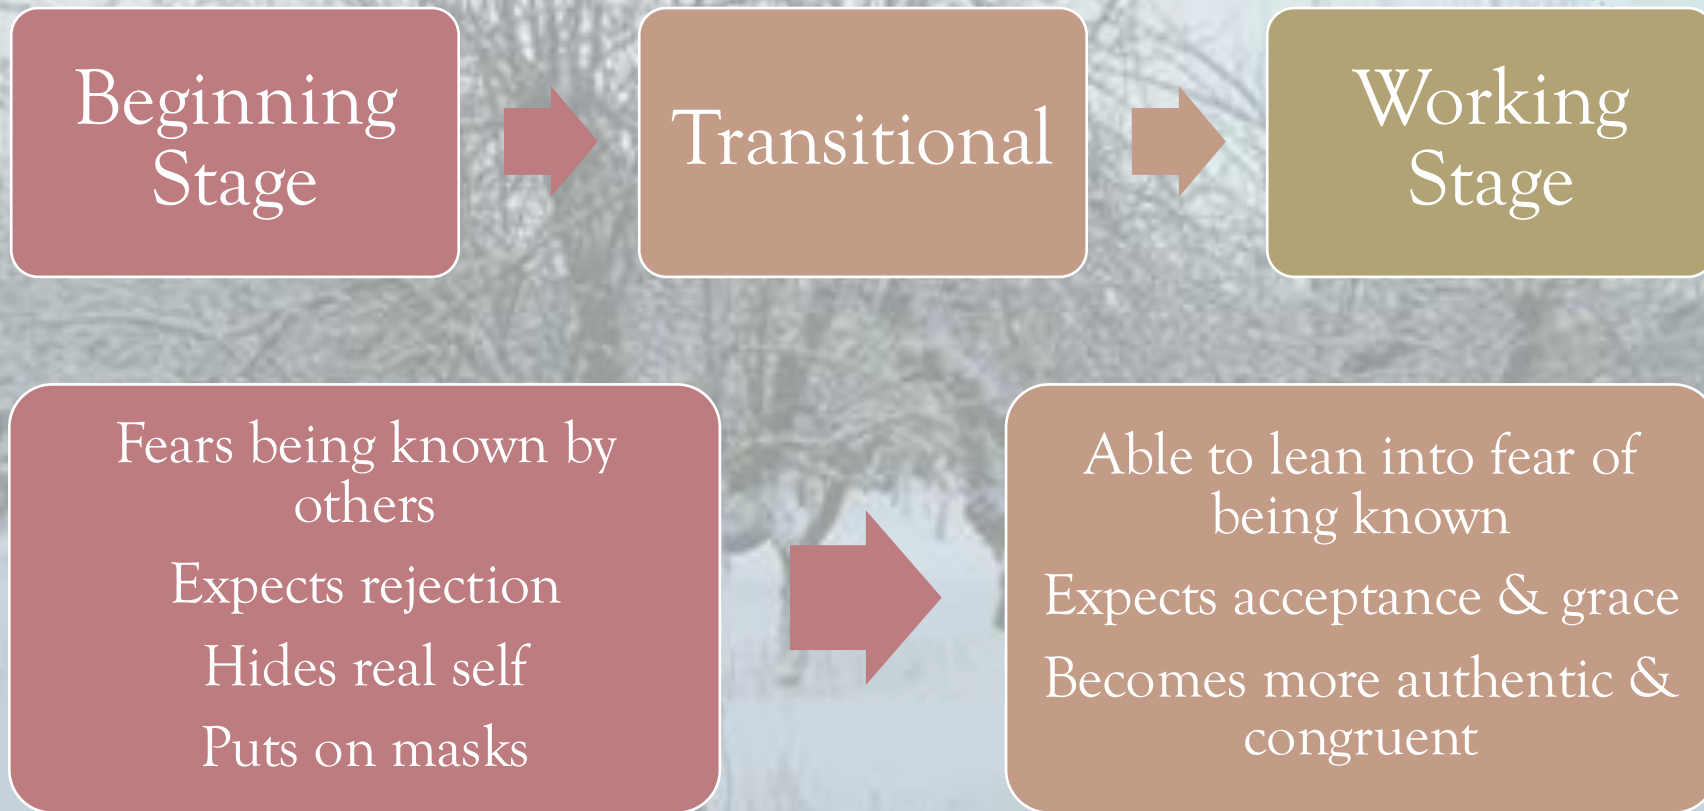

To take a real-world example, Apple's share of the global smartphone (let alone all mobiles!) is a mere 10% or so (bit.ly/i29qAH). A year ago it was a pathetic 5.3%. On the face of it you'd hardly call it a stellar success story. However as of October 2010 (bit.ly/fli2tz) Apple is however making half of the total profit being made *across* in the entire smartphone market.

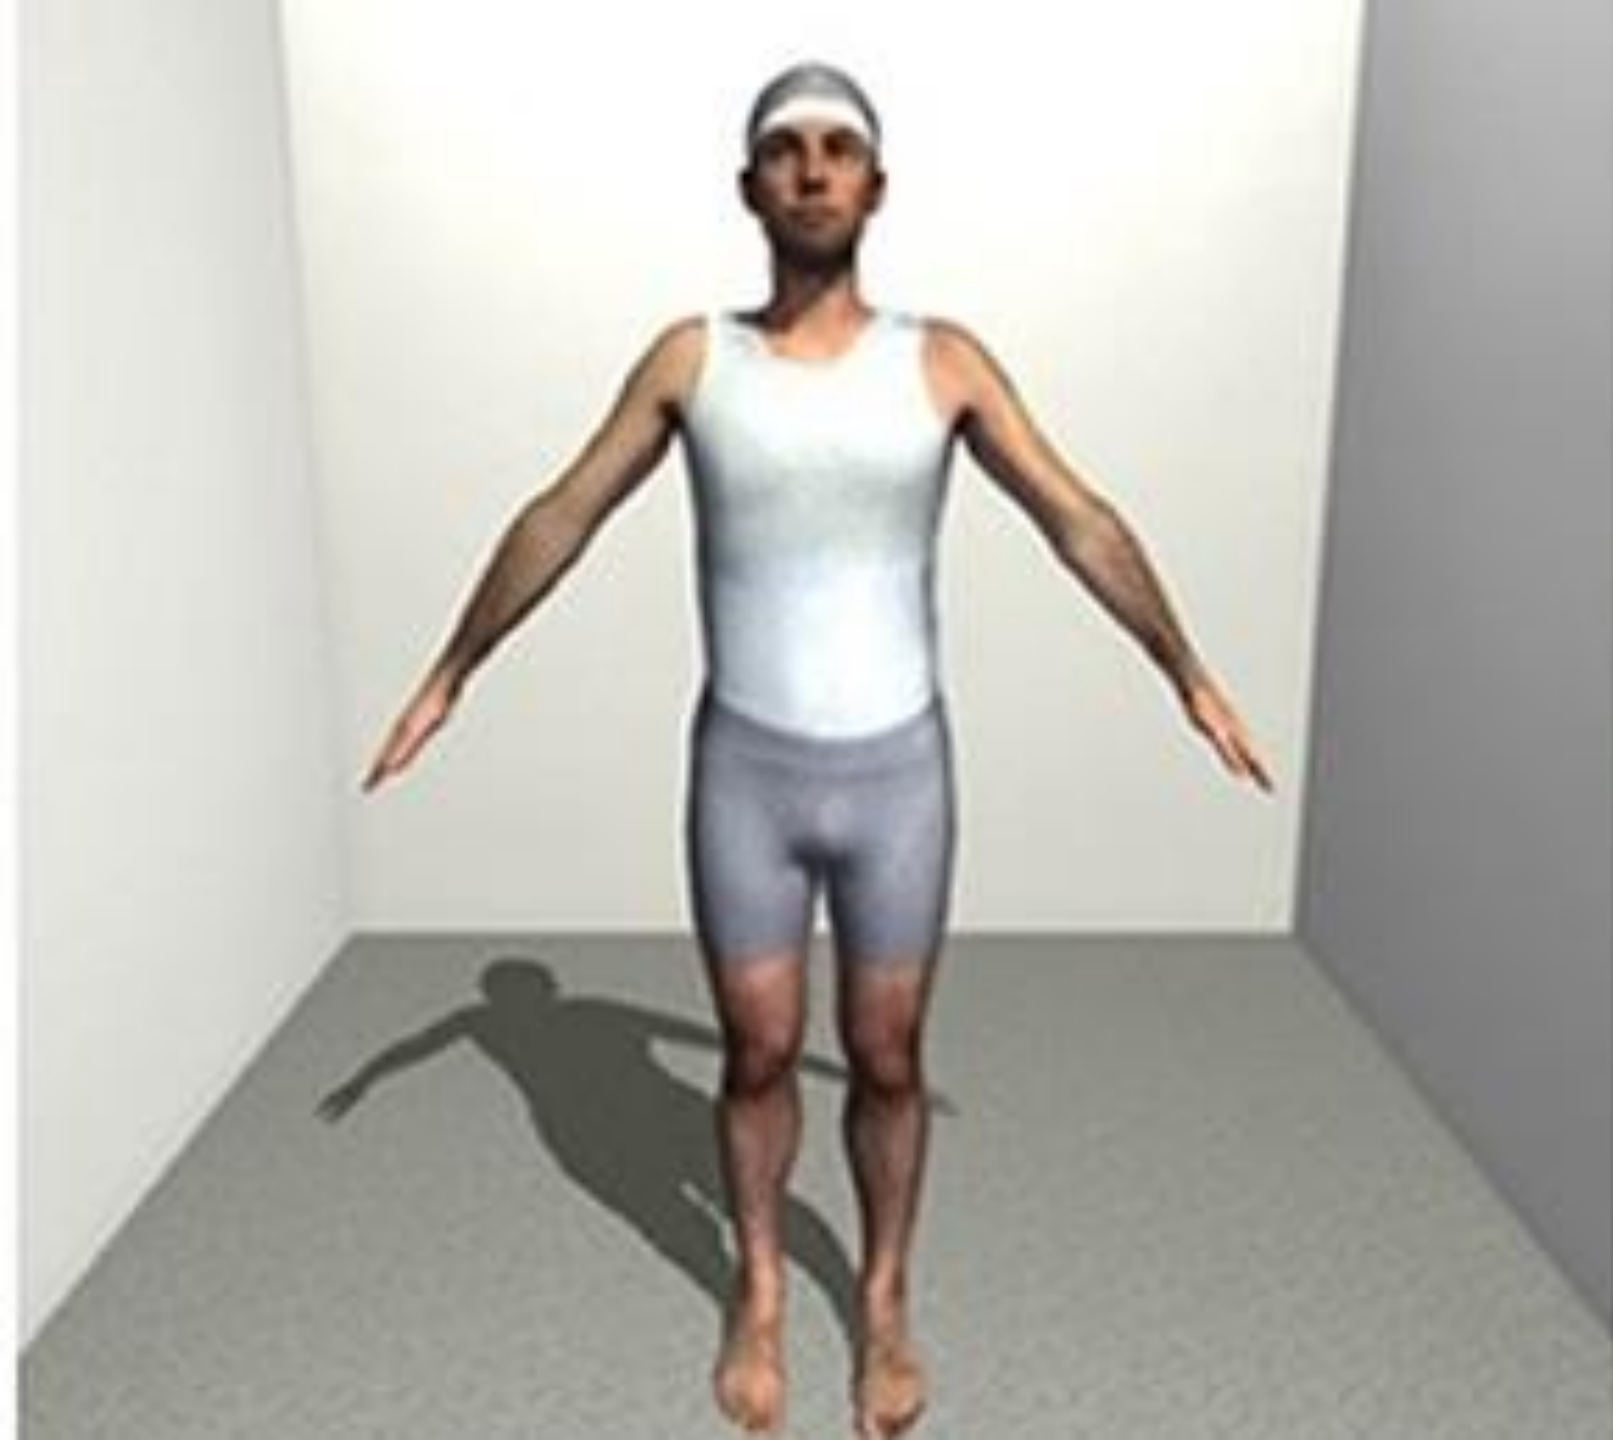

There are now a number of startups providing sophisticated real-time analytics platforms – see your traffic in real time, with dials and live graphs! But what value is there to seeing there are currently 14 visitors browsing your site? These tools make it easy to jump at shadows, reacting to random changes and
